

# 1 The routed pipeline

## Mixed-horizon bank (76 tasks)

### Horizon router

reads horizon + service line

#### SH lane (CFO only, 20% of bank)

- budget 60-180 s, · 10 tool calls
- Rule check (+ light side-effect)
- Partial Credit / All-Pass
- no trajectory / self-verify grading

#### LH lane (CFO 30% + DD 50%, 80% of bank)

- budget 300-1200 s, 20-30+ tool calls
- Hybrid: Rule + State-audit + Judge
- tool-use / trajectory + safety + timeout
- self-verification (tie-out) required

### Per-task score

Partial Credit (dealbreaker-gated: fabrication or safety)

Class-balanced accuracy *within*  
service line × horizon  
(also per BI band / tool)

### Applies to both lanes

- leakage guard · defect & safety injection · discriminability filter · judge validation

**Headline** =  $0.20 \cdot \bar{S}_{SH} + 0.80 \cdot \bar{S}_{LH}$   
guardrail: VOID autonomy & time-saved if  
bad-auto-post > ceiling or any safety violation
